

Apply filters to SQL queries

Project description

Accomplished to navigate, filter, and get results from a database

Retrieve after hours failed login attempts

In this query, we select all columns from the table `log_in_attempts`. We then use the where clause to specify the failed login attempts that occur at the time more than 18:00

```
SELECT * FROM log_in_attempts
```

```
WHERE login_time > '18:00' AND success = 0;
```

Retrieve login attempts on specific dates

To retrieve a login attempts on a specific dates, We use the BETWEEN clause to specify the range of the date to be retrieved

```
SELECT * FROM log_in_attempts
```

```
WHERE login_date BETWEEN '2022-05-08' AND '2022-05-09'
```

Retrieve login attempts outside of Mexico

TO retrieve all login attempts outside Mexico, LIKE clause is used to specify that we are trying to find something like. Mex% is used to specify the string that we are trying to locate for. We use NOT sign to specify that we are trying to find all entries that did not start with Mex

```
SELECT * FROM log_in_attempts
```

```
WHERE NOT country LIKE 'MEX%'
```

Retrieve employees in Marketing

To get all the employees from the Marketing department at the East Office Building. We use the AND clause

```
SELECT * FROM employees
```

```
WHERE department = 'Marketing' AND office LIKE 'East%'
```

Retrieve employees in Finance or Sales

To get all the employees from the Marketing or Sales department at the East Office Building.

We use the OR clause

```
SELECT * FROM employees
```

```
WHERE department = 'Marketing' OR department = 'Sales'
```

Retrieve all employees not in IT

To get all the employees not from the IT department, we use the NOT clause

```
SELECT * FROM employees
```

```
WHERE NOT department = 'Information Technology'
```

Summary

We can use the NOT clause to specify the outside range, AND to include both datasets, OR to include either one of the datasets, % sign to specify if the string starts or ends with, BETWEEN, >, <, >=, <= to specify range
